Abstract

The AI-Based Student Performance Prediction System is an intelligent educational system designed to predict and analyze students' academic performance using Artificial Intelligence and Machine Learning techniques. The system collects and analyzes various academic and behavioral factors such as attendance, internal examination marks, assignment performance, previous academic results, participation, and other relevant student-related parameters. Based on these inputs, machine learning algorithms are used to identify performance patterns and predict the likely academic outcomes of students. The proposed system aims to help faculty members and educational institutions identify students who may be at academic risk at an early stage. By providing performance predictions and meaningful insights, the system can support teachers in taking timely corrective measures, such as personalized guidance, additional learning resources, and academic mentoring. The system can also help students understand their strengths and weaknesses and improve their learning strategies. Overall, the proposed AI-based approach provides a data-driven and proactive solution for monitoring student performance, enabling early intervention, improving academic outcomes, and supporting effective educational decision-making.
